

Fraud Assignment

You are in charge of developing a framework to detect fraud for a life insurance company. The life insurance company services many the entire nation, but you will only be working with customer data from their west coast branches. The company has never done any fraud modeling in the past, so you will be starting from scratch.

Supervised Learning

Now that you have received your results from the “domain expert” about your unsupervised learning techniques, you can build a model to try and predict “fraud”. You are welcome to use any modeling approach you want (or any combination of them). Your assignment is to turn in a list of the 500 claims that are most likely to be fraudulent. The team with the highest number of actual fraudulent cases as well as the most money saved will win the prize! Email this list to sjsimmo2@ncsu.edu by March 30 at 5:00 PM.

Good hunting!
